

SOUL'S ACCESS ADSL

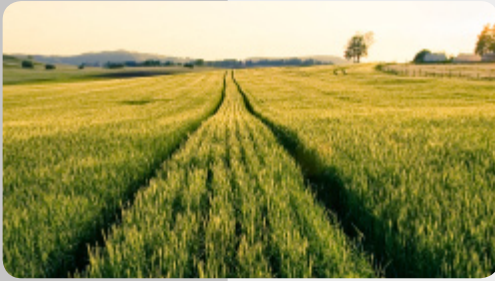

SOUL'S ACCESS ADSL

Product Overview

Soul has an extensive broadband network covering over a thousand exchanges across Australia. Unlike other broadband offerings, Soul's Access ADSL product has been purpose built to carry Business - Grade traffic and is available for Internet and Private Network solutions. Soul is a leader in providing proven retail based solutions using ADSL technology.

ADSL is a technology that allows existing telephone lines to be used for high-speed data transmission. ADSL is an entry-level connection that is low cost and suitable for transferring business data but not business voice.

This product is asymmetric, which means it is able to deliver more bandwidth downstream as opposed to upstream. However, it can also be purchased symmetrically in the speed of 512/512K.

Simplicity of Configuration

One of the great benefits of Soul's IP VPNs using Access ADSL, when compared with circuit based WAN's such as Frame Relay, is the simplicity of router configuration. You simply attach a site to your VPN and it learns all routes to all other sites. This has the added benefit of reducing port and tail access size at what would have been hub sites in a traditional Hub and Spoke WAN.

When migrating from a Frame Relay WAN you can expect immediate savings through bandwidth reduction by eliminating traffic tromboning at hub sites. Additionally, greater cost savings and performance increases are available as you tune your WAN for optimal performance.

SOUL'S ACCESS ADSL

Quick Facts

- Speeds from 256/64kbps, to 24/1Mbps
- Can be purchased as 512/512kbps symmetric ADSL
- Ubiquitous coverage
- ADSL2+ in limited exchange areas only
- Suitable for transferring business data but not voice

Applications

- Internet
- Branch office secure LAN access
- Does not suit mission critical data requirements
